## 1 General experimental

All chromatographic separations ${ }^{1}$ were performed on Silica, 10-18, $60 \AA$, ICN Biomedicals. Standard techniques were used for the purification of reagents and solvents. ${ }^{2}$ NMR spectra were recorded on a Varian Gemini $200\left({ }^{1} \mathrm{H} \mathrm{NMR}\right.$ at $200 \mathrm{MHz},{ }^{13} \mathrm{C}$ NMR at 50 MHz$)$, and on Bruker Avance III $500\left({ }^{1} \mathrm{H}\right.$ NMR at $500 \mathrm{MHz},{ }^{13} \mathrm{C} N \mathrm{NR}$ at 125 MHz ), in deuterated chloroform if not otherwise stated. Chemical shifts are expressed in ppm ( $\delta$ ) using tetramethylsilane as internal standard, coupling constants (J) are in Hz. IR spectra were recorded on a Nicolet 6700 FT instrument, and are expressed in $\mathrm{cm}^{-1}$. Mass spectra were obtained on Agilent technologies 6210 TOF LC/MS instrument (LC: series 1200) or LTQ Orbitrap XL hybrid FTMS (Thermo Scientific). Microanalyses were performed at the Vario EL III instrument CHNOS Elementar Analyzer, Elementar Analysensysteme GmbH, Hanau-Germany. Optical rotation was measured on Rudolph Research Analytical AUTOPOL IV Automatic Polarimeter. Melting points were determined on a Kofler hot-stage apparatus and are uncorrected.

## X-ray crystal structure determination

A single colorless crystal was selected and glued on glass fiber. Diffraction data were collected on an Oxford Diffraction KM4 four-circle goniometer equipped with Sapphire CCD detector. The crystal to
detector distance was 45.0 mm and a graphite monochromated $\operatorname{MoK} \alpha$ ( $\lambda=0.71073 \AA$ A ) X-radiation was employed in the measurements. The frame widths of $1^{\circ}$ in $\omega$, with 19 and 27 s were used to acquire each frame. More than a hemisphere of three-dimensional data was collected in all measurements. The data were reduced using the Oxford Diffraction program CrysAlisPro. A semiempirical absorptioncorrection based upon the intensities of equivalent reflections was applied, and the data were corrected for Lorentz, polarization, and background effects. Scattering curves for neutral atoms, together with anomalous-dispersion corrections, were taken from International Tablesfor X-ray Crystallography. ${ }^{3}$ The structures were solved by direct methods, ${ }^{4}$ and the figures were drawn using MERCURY. ${ }^{5}$ Refinements were based on F2 values and done by full-matrix least-squares ${ }^{6}$ with all non-H atoms anisotropic. The positions of all non H -atoms were located by direct methods. The positions of hydrogen atoms were found from the inspection of the difference Fourier maps. The final refinement included atomic positional and displacement parameters for all non-H atoms. The non-H atoms were refined anisotropically. However, at the final stage of the refinement, H atoms belonging to molecules were positioned geometrically ( $\mathrm{O}-\mathrm{H}=0.82$ and $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ ) and refined using a riding model with fixed isotropic displacement parameters.

## 2 Experimental procedures

Aqueous solution of sodium periodate ( 4.35 g of $\mathrm{NaIO}_{4}$ in 50 mL of distilled water; $20.3 \mathrm{~mol} ; 3.5 \mathrm{eq}$ ) was added dropwise to the methanolic solution of ( $2 S, 3 R$ )-3,7-dimethyloct-6-en-1,2-diol (1 g of the diol in 45 mL of methanol; 5.8 mmol ). The resulting milky white suspension was stirred at room temperature for 30 minutes, before it was partitioned between dichloromethane and water. The aqueous layer was extracted with dichloromethane ( $3 \times 40 \mathrm{~mL}$ ) and the combined organic extract was dried over $\mathrm{MgSO}_{4}$. The extract was concentrated under reduced pressure ( $300 \mathrm{mmHg}, 25^{\circ} \mathrm{C}$ ), the residue filtered through a short pad of silica, and eluted with dichloromethane. Removal of solvent at rotovap afforded 660 mg ( $80 \%$ ) of ( $R$ )-2,6-dimethylhept-5-enal 5 , as a colorless liquid with a pleasant odor.

Spectral data identical to those reported in the literature. ${ }^{8}$

## 2.2 (S)-4-benzyl-3-((2S,3R,4R)-2-(benzyloxy)-3-hydroxy-4,8-dimethylnon-7-enoyl)oxazolidin-2-one (8)

Triethylamine ( 6 mL ; 43 mmol ; 1.40 eq ) was added to a cold $\left(-78{ }^{\circ} \mathrm{C}\right)$ solution of $(S)$-4-benzyl-3-(2-(benzyloxy)acetyl)-oxazolidin-2-one 7 ( $10.34 \mathrm{~g} ; 31.8 \mathrm{mmol} ; 1.04 \mathrm{eq}$ ) in dry dichloromethane ( 130 mL ), under an argon atmosphere, followed by a dropwise addition ( 10 min ) of di-n-butylboron trifluoromethanesulfonate ( $9.3 \mathrm{~mL} ; 37 \mathrm{mmol} ; 1.2 \mathrm{eq}$ ). The mixture was allowed to reach $0{ }^{\circ} \mathrm{C}$ during one hour, stirred continuously for 15 minutes, and then cooled again to $-78{ }^{\circ} \mathrm{C}$. A solution of $(R)$ norcitronellal 5 ( 4.3 g ; $30.7 \mathrm{mmol} ; 1 \mathrm{eq}$ ) in dry dichloromethane ( 20 mL ) was added dropwise into the reaction mixture, and stirring was continued for 10 minutes at $-78{ }^{\circ} \mathrm{C}$. The mixture was allowed to reach $0^{\circ} \mathrm{C}$ during 1.5 h and stirring continued for 4 h at that temperature. After cooling to $-25^{\circ} \mathrm{C}$, the reaction was carefully quenched by simultaneous addition of phosphate buffer ( 140 mL ) and methanol ( 400 mL ), keeping the temperature below $-15^{\circ} \mathrm{C}$. A mixture of methanol and $30 \%$ hydrogen peroxide ( $2: 1 ; 280 \mathrm{~mL}$ ) was then added while maintaining the same temperature, and stirring continued for 1 h at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was extracted with dichloromethane ( $3 x 300 \mathrm{~mL}$ ), the organic layer was washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification of the crude product by MPL chromatography (eluent: toluene : ethyl acetate = $5: 1$ ) afforded $10.92 \mathrm{~g}(77 \%)$ of aldol 8, as a very viscous, colorless oil, which was preceded by unreacted starting oxazolidinone 7 ( 1.84 g ). The yield based on the recovered starting oxazolidinone was $90 \%$.

A) Compound 75 (Reductive elimination of the oxazolidinone chiral auxillary with sodium borhydride): Sodium borohydride ( $15 \mathrm{mg} ; 0.4 \mathrm{mmol} ; 5 \mathrm{eq}$ ) was added to a solution of aldol $8(37 \mathrm{mg} ; 0.08 \mathrm{mmol})$ in tetrahydrofuran/water mixture ( $5: 2 ; 1.4 \mathrm{~mL}$ ) and the mixture was stirred 75 minutes at room temperature, before the excess of the reducing agent was destroyed by careful addition of saturated ammonium chloride solution ( 2 mL ). The mixture was extracted with ethyl acetate ( $2 \times 20 \mathrm{~mL}$ ), the organic layer was rinsed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The crude mixture of the diol 75 and oxazolidinone was used in next step without purification.

Solid $m$ CPBA ( $0.726 \mathrm{~g} 77 \% \mathrm{mCPBA} ; 3.24 \mathrm{mmol} ; 1.3 \mathrm{eq}$ ) was added in several portions to the ice cold solution of (( $4 R, 5 R, 6 R, E$ )-4-(benzyloxy)-1-bromo-6,10-dimethylundeca-2,9-dien-5-yloxy)(tert-butyl) dimethylsilane 14 ( $1.235 \mathrm{~g} ; 2.49 \mathrm{mmol}$ ) in dichloromethane ( 36 mL ). After all the starting material was epoxidized ( 15 min ), the reaction mixture was diluted with dichloromethane ( 200 mL ), and washed successively with $10 \%$ sodium thiosulfate, saturated sodium bicarbonate and brine. The organic layer was dried over $\mathrm{MgSO}_{4}$ and solvent evaporated, to yield the crude epoxide. Saturated solution of periodic acid in diethyl ether ( $630 \mathrm{mg} \mathrm{H} \mathrm{H}_{5} \mathrm{O}_{6} / 150 \mathrm{~mL}$ diethyl ether; $2.76 \mathrm{mmol} ; 1.1 \mathrm{eq}$ ) was added to the ethereal solution ( 20 mL ) of the crude epoxide, causing the mixture to become milky white. After 15 minutes the fragmentation was complete and the mixture was washed with $10 \%$ sodium thiosulfate, saturated sodium bicarbonate and brine. The organic phase was dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure, to afford 1.13 g of the crude aldehyde $\mathbf{1 5}$, which was used directly in the next step, without purification.

To a solution of crude aldehyde 15 ( 32 mg ; 0.068 mmol ) in dry DMF ( 1.2 mL ) was added finely powdered Oxone ${ }^{\circledR}$ ( $63 \mathrm{mg} ; 0.1 \mathrm{mmol} ; 1.5 \mathrm{eq}$ ) and the resulted heterogeneous mixture was stirred 1.5 h at room temperature, under an argon atmosphere. The mixture was diluted with diethyl ether ( 50 mL ) and the organic extract was washed with 0.5 M hydrochloric acid. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure, to afford the corresponding acid. The crude acid was dissolved in diethyl ether ( 1.5 mL ), the solution was cooled to $0^{\circ} \mathrm{C}$ and treated with a cold solution of diazomethane in ether, until yellow color persists. After additional 30 minutes of stirring, the reaction mixture was concentrated at rotovap. Purification of the residue by dry-flash chromatography (petroleum ether : ethyl acetate $=97: 3$ ) afforded $25.4 \mathrm{mg}(75 \%)$ of methyl ester 16 , as a colorless oil.

After allowing to reach room temperature, the mixture was partitioned between ethyl acetate and brine. The organic extract was dried over anhydrous $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. Purification of the residue by dry-flash chromatography (petroleum ether : ethyl acetate $=5: 1$ ) afforded $23 \mathrm{mg}(85 \%)$ of debenzylated products 24 (a mixture of silyl-ether regioisomers), as a colorless oil. The product was used in the next deprotection step, without prior separation of regioisomers.

A solution of concentrated hydrofluoric acid ( $120 \mu \mathrm{~L}$ ), acetonitrile ( $730 \mu \mathrm{~L}$ ) and the mixture of regioisomers 24 from the previous step ( $23 \mathrm{mg} ; 0.070 \mathrm{mmol}$ ) was stirred at room temperature for 4 days, in a polyethylene vessel. The mixture was partitioned between ethyl acetate and saturated sodium bicarbonate, the organic layer was washed with brine and dried over anhydrous $\mathrm{MgSO}_{4}$. The crude product was purified by dry-flash chromatography (petroleum ether : ethyl acetate $=1: 1$ ), affording $14.3 \mathrm{mg}(91 \%)$ of diol $\mathbf{2 5}$, as a white solid. The product was recrystallized from $n$-hexane/ethyl acetate, yielding well defined needle-like colorless crystals, suitable for X-ray analysis.

A) Sharpless asymmetric dihydroxylation: To a solution of silylenolether $\mathbf{2 8}$ ( $177 \mathrm{mg} ; 0.325 \mathrm{mmol}$ ) in tertbutanol/water mixture (1:1.4; 2.4 mL ) was added (DHQD) ${ }_{2} \mathrm{PHAL}\left(25 \mathrm{mg} ; 10 \mathrm{~mol} \%\right.$ ), $\mathrm{K}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right](214 \mathrm{mg}$; $0.65 \mathrm{mmol} ; 2 \mathrm{eq}$ ), potassium carbonate ( 135 mg ; $0.975 \mathrm{mmol} ; 3 \mathrm{eq}$ ) and potassium osmate dihydrate (18 $\mathrm{mg} ; 15 \mathrm{~mol} \%$ ). The mixture was stirred for 48 h at $4^{\circ} \mathrm{C}$ and saturated sodium sulfite solution (1 mL) was added. After additional 24 h of stirring, the mixture was partitioned between ethyl acetate ( 50 mL ) and water ( 15 mL ). The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification of the residue by dry flash chromatography (eluent: petroleum ether : ethyl acetate = 96 : 4), afforded 68 mg of the unreacted starting compound 28, followed by 76 mg ( $58 \%$ or $94 \%$ based on recovered starting material) of product 30, as a colorless oil.
If equivalent amount of $(\mathrm{DHQ})_{2} \mathrm{PHAL}$ was used instead of (DHQD) ${ }_{2} \mathrm{PHAL}$, the same stereoisomer was isolated in 39\% yield.
B) Epoxidation with $m$ CPBA: Solid $m$ CPBA ( $77 \% ; 14.7 \mathrm{mg} ; 0.085 \mathrm{mmol} ; 2.5 \mathrm{eq}$ ) was added to a cold ( -30

After 1.5 h of stirring, HF-pyridine complex ( $50 \mu \mathrm{~L}$ ) was added and stirring was continued for one hour at room temperature. Silica ( 100 mg ) was added to the mixture, all volatiles were removed on rotovap and the residue was
purified by column chromatography (eluent: petroleum ether : ethyl acetate $=9: 1$ ), affording 11.7 mg (85\%) of the diastereoisomeric mixture of 29 and 30 ( $29: 30=1.5: 1$ ), as a colorless oil.
C) Epoxidation with MMPP: Magnesium monoperoxyphthalate ( $80 \% ; 23 \mathrm{mg} ; 34 \mu \mathrm{~mol} ; 1 \mathrm{eq}$ ) was added to a solution of silylenolether $28(20 \mathrm{mg} ; 34 \mu \mathrm{~mol})$ in ethanol ( 3 mL ). After 3 h of stirring, HF-pyridine complex ( $50 \mu \mathrm{~L}$ ) was added and stirring was continued for one hour at room temperature. Silica (100 mg ) was added to the mixture, all volatiles were removed on rotovap and the residue was purified by column chromatography (eluent: petroleum ether : ethyl acetate $=9: 1$ ), to afford $6.3 \mathrm{mg}(46 \%)$ of the mixture of diastereoisomers 29 and 30 (29:30=1:4), as a colorless oil.
D) Epoxidation with DMDO: A freshly prepared ${ }^{9}$ solution of dimethyldioxirane ( 0.75 mL ) was added dropwise to a solution of silylenolether $\mathbf{2 8}(20 \mathrm{mg} ; 0.034 \mathrm{mmol})$ in dry dichloromethane ( 1.2 mL ), during 10 minutes. Epoxide HF-pyridine complex ( $100 \mu \mathrm{~L}$ ) was added to this solution and stirring was continued for 2 h at room temperature. Silica ( 100 mg ) was added to the mixture, all volatiles were removed on rotovap and the residue was purified by column chromatography (eluent: petroleum ether : ethyl acetate $=9: 1$ ), to afford $11.3 \mathrm{mg}(82 \%)$ of product $\mathbf{3 0}$, as a colorless oil.
E) Epoxidation with a modified Davis' oxaziridine: Solution of silylenolether 28 ( $3.4 \mathrm{mg} ; 5.8 \mathrm{mmol}$ ) and 2-benzenesulphonyl-3-(p-nitrophenyl)oxaziridine ( $70 \%$ purity; $2.8 \mathrm{mg} ; 1.1 \mathrm{eq}$ ) in chloroform ( 0.2 mL ) was stirred for 3 h at $65^{\circ} \mathrm{C}$. The reaction mixture was cooled to room temperature, HF-pyridine complex (50 $\mu \mathrm{L}$ ) was added and stirring was continued for an additional hour. The reaction mixture was purified by column chromatography (eluent: petroleum ether : ethyl acetate = $9: 1$ ), to afford $2.0 \mathrm{mg}(86 \%)$ of product 30, as a colorless oil.

A) Reaction with 3,3,3-triethoxyprop-1-yne: $n$-Butyl lithium ( 1.5 M in hexanes; $4.1 \mathrm{~mL} ; 6.12 \mathrm{mmol} ; 3.5$ eq) was added to the cold ( $-30^{\circ} \mathrm{C}$ ) solution of diisopropylamine ( $865 \mu \mathrm{~L} ; 6.12 \mathrm{mmol} ; 3.5 \mathrm{eq}$ ) in dry toluene ( 30 mL ). After 30 minutes of stirring, the resulting solution of LDA was cooled to $-78{ }^{\circ} \mathrm{C}$ and 3,3,3-triethoxyprop-1-yn ( $1.204 \mathrm{~g} ; 6.99 \mathrm{mmol} ; 4 \mathrm{eq}$ ) was added dropwise. The stirring was continued for additional 30 minutes and the solution of ( $2 S, 3 R, 4 R, 5 R$ )-3-(benzyloxy)-4-(tert-butyldimethylsilyloxy)-5-methyl-2-vinylcyclohexanone 37 ( $655 \mathrm{mg} ; 1.748 \mathrm{mmol}$ ) in dry toluene ( 60 mL ) was added dropwise. After 20 minutes the reaction was allowed to warm up to $0{ }^{\circ} \mathrm{C}$ during one hour and the reaction was quenched with brine ( 20 mL ). The product was extracted with ethyl acetate, the organic layer dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The crude product was purified by dry flash chromatography (gradient elution: petroleum ether : ethyl acetate, from $95: 2$ to $9: 1$ ), to give 782 mg of the mixture of compounds 48 and $\mathbf{5 0}$, which was used as such in the following transformation (i. e. experiment 2.36).
B) Reaction with ethyl propiolate: $n$-Butyl lithium ( 1.36 M in hexanes; $28 \mu \mathrm{~L} ; 1.5 \mathrm{eq}$ ) was added to the cold $\left(-78{ }^{\circ} \mathrm{C}\right.$ ) solution of ethyl propiolate ( $3.4 \mu \mathrm{~L}$; $0.033 \mathrm{mmol} ; 1.3 \mathrm{eq}$ ) in dry THF ( 0.8 mL ). After 60 minutes of stirring, a solution of ketone 37 ( 9.6 mg ; 0.026 mmol ) in dry THF ( 0.2 mL ) was added dropwise. The mixture was allowed to reach room temperature during 60 minutes and the reaction was quenched by the addition of saturated ammonium chloride solution. The mixture was extracted with ethyl acetate, washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The crude product was purified by column chromatography (eluent: petroleum ether : ethyl acetate $=9: 1$ ), to give $4 \mathrm{mg}(33 \%)$ of the product $\mathbf{4 8}$, as a colorless oil.

### 2.36 Ethyl 3-(1R,2S,3R,4R,5R)-3-(benzyloxy)-1,4-dihydroxy-5-methyl-2vinylcyclohexyl)propiolate (51)

The mixture of propiolate 48 and the corresponding orthoester $50(782 \mathrm{mg})$, from the previous step, was dissolved in acetonitrile ( 5 mL ) in a polyethylene flask, and $50 \%$ hydrofluoric acid ( 2.1 mL ) was added dropwise to the solution. The mixture was stirred at $60^{\circ} \mathrm{C}$ for 9 h , and then partitioned between ethyl acetate and saturated sodium bicarbonate solution. The organic extract was washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The residue was purified by column chromatography (eluent: petroleum ether : ethyl acetate =5:2) to give 473 mg ( $75 \%$ from 37) of diol 51, as a colorless solid.

A stream of oxygen enriched with ozone was bubbled through the cold $\left(-78{ }^{\circ} \mathrm{C}\right)$ solution of alkene 65 ( 124 mg ; 0.2065 mmol ) in dry dichloromethane ( 12 mL ) for 12 minutes, when the reaction mixture turned light blue. The excess ozone was removed by bubbling argon gas, followed by the addition of dimethyl sulfide ( 0.2 mL ). The mixture was stirred at room temperature for 5 h , when DBU ( $6.2 \mu \mathrm{~L}$; 20 mol\%) was added and stirring was continued for 24 h . Another portion of DBU ( $3.1 \mu \mathrm{~L} ; 10 \mathrm{~mol} \%$ ) was then added, and after additional 24 h of stirring the isomerization was complete (the progress of the reaction was followed by ${ }^{1} \mathrm{H}$ NMR spectroscopy). The solvent was removed under reduced pressure and the residue purified by column chromatography (petroleum ether : ethyl acetete $=2: 1$ ) to give 100 mg (81\%) of aldehyde 66 as a colorless oil.

After additional stirring at $45^{\circ} \mathrm{C}$ for 15 minutes, the mixture was partitioned between diethyl ether and diluted hydrochloric acid (1M). The etheral layer was washed with diluted hydrochloric acid ( 1 M ), brine, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification of the residue by column chromatography (gradient elution: petroleum ether : ethyl acetate $=3: 1 \rightarrow 1: 1$ ) afforded $34 \mathrm{mg}(90 \%)$ of the title compound 69 as a mixture of four diastereoisomers. Additionally, 3.4 mg of the unreacted starting material was isolated; therefore, the yield based on the recovered starting material was $96 \%$.

A solution of compound $69(3.5 \mathrm{mg} ; 7.22 \mu \mathrm{~mol})$ and concentrated hydrochloric acid ( $15 \mu \mathrm{~L}$ ) in methanol $(0.2 \mathrm{~mL})$ was stirred at room temperature for 4 days and then evaporated under reduced pressure. The residue was dissolved in dry dichloromethane ( 0.8 mL ) and Dess Martin's periodinane ( 30.6 mg ; 0.722 $\mu \mathrm{mol} ; 10 \mathrm{eq})$ was added. The mixture was stirred for 3 h at room temperature, then partitioned between diethyl ether and water. The organic layer was washed with $10 \%$ sodium thiosulfate, sodium bicarbonate and brine, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification of the residue by column chromatography (eluent: petroleum ether : ethyl acetate $=3: 1$ ) afforded 0.5 mg (14\%) of chloro-derivative 71, followed by 2.4 mg (78\%) of the compound 70, as colorless oils.

## 3 Biological test

### 3.1. Antibacterial activity

The agar plate diffusion assay, and the determination of MIC values were performed according to the literature procedure. ${ }^{12}$ The determination of MIC was modified, with respect to the literature procedure, in that Mueller Hinton broth was used.

### 3.2. Cytotoxicity assay

Reagents: RPMI-1640 medium was purchased from PAA The Cell Culture Company (Linz, Austria), Fetal calf serum (FCS), 3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT), gentamicin sulfate salt, penicillin, streptomycin, glutamine, $\beta$-mercaptoethanol, phytohemagglutinin (PHA), dimethyl sulfoxide (DMSO) and Histopaque were purchased from the Sigma Chemical Co. (St. Louis, MO, USA), $0.22 \mu \mathrm{~m}$ Millipore Ultrafree-MC centrifugal devices were purchased from Merck Millipore (Billerica, Massachusetts, US).

Cell culture. Human cervix adenocarcinoma cells (HeLa), were grown in RPMI-1640 medium supplemented with $10 \%$ fetal calf serum (FCS), $1 \%$ glutamine ( 200 mM ), $1 \%$ penicillin ( $10000 \mathrm{IU} \mathrm{mL}^{-1}$ ) and $1 \%$ streptomycin ( $10 \mathrm{mg} \mathrm{mL}^{-1}$ ). The cells were grown at $37{ }^{\circ} \mathrm{C}$ in a $6.0 \% \mathrm{CO}_{2}$ humidified air atmosphere. Peripheral blood mononuclear cells (PBMC) were separated from whole heparinized blood of healthy volunteer. Blood was diluted with phosphate buffered saline (PBS) (1:1) and layered on Histopaque solution. After centrifugation, interface cells were collected and washed three times with PBS. After counting, cells were resuspended in nutrient medium. Nutrient medium was RPMI-1640 medium, supplemented with $10 \%$ fetal calf serum (FCS), $1 \%$ glutamine ( 200 mM ), $1 \% \quad \beta-$ mercaptoethanol $(5 \mu \mathrm{M})$, 1\% penicillin (10000 $\mathrm{IU} \mathrm{mL}^{-1}$ ), $1 \%$ streptomycin ( $10 \mathrm{mg} \mathrm{mL}^{-1}$ ) and with $0,5 \%$ phytohemagglutinin (PHA) (1 mg mL ${ }^{-1}$ ). The cells were grown at $37^{\circ} \mathrm{C}$ in a humidified atmosphere with $6 \% \mathrm{CO}_{2}$.

Determination of target cell survival. HeLa cells were seeded (10 000 cells per well) into 96-well microtiter plates and 24 h later, after the cell adherence, six different concentrations of investigated compounds were added to the wells. Final concentrations were in the range from 0,0144 nM to 144 nM for HeLa cells and PBMCs. Only nutrient medium was added to the cells in the control wells. All experiments were done in triplicate. Nutrient medium void of cells was used as blank. PBMC were seeded (200,000 cells per well) into nutrient medium in 96-well microtiter plates and 2 h later, investigated compounds were added to the wells, in triplicates, to six final concentrations, except to the control wells where a nutrient medium only was added to the cells. Nutrient medium void of cells was used as blank. Cell survival was determined by MTT test according to the method of Mosmann ${ }^{13}$ and modified by Ohno and Abe, ${ }^{14} 24$ and 72 h after the drug addition to HeLa cells and PBMCs, respectively. Briefly, $20 \mu \mathrm{~L}$ of MTT solution ( $5 \mathrm{mg} / \mathrm{mL}$ in PBS) were added to each well and incubated for 4 h at $37{ }^{\circ} \mathrm{C}$ in humidified atmosphere with $6 \% \mathrm{CO}_{2}$. After the incubation, medium was carefully removed and $200 \mu \mathrm{~L}$ of DMSO were added to dissolve the formazan complexes; absorbance was read at 492 nm . The IC50 value which represents drug concentration that diminishes $50 \%$ of viable cells was assessed from the graph of cell survival vs. concentration of the investigated compound.
