## General experimental

All chromatographic separations ${ }^{[1]}$ were performed on Silica gel 60 ( $0.063-0.2 \mathrm{~mm}$ ), Merck. Standard techniques were used for the purification of reagents and solvents. ${ }^{[2]}$ NMR spectra were recorded on Bruker Avance III $500\left({ }^{1} \mathrm{H} N \mathrm{NR}\right.$ at $500 \mathrm{MHz},{ }^{13} \mathrm{C}$ NMR at 125 MHz ), in deuterated chloroform, if not otherwise stated. Chemical shifts are expressed in ppm ( $\delta$ ) using tetramethylsilane as internal standard, coupling constants (J) are in Hz. IR spectra were recorded on a Nicolet 6700 FT instrument, and are expressed in $\mathrm{cm}^{-1}$. Mass spectra were obtained on Agilent technologies 6210 TOF LC/MS instrument (LC: series 1200). Melting points were determined on a Kofler hot-stage apparatus and are uncorrected.

## 1 Experimental procedures

## 1.1 tert-Butyl 2-(2-ethoxy-2-oxoethyl)-3-methyl-1H-indole-1-carboxylate (12)

DMAP ( $48 \mathrm{mg} ; 0.39 \mathrm{mmol} ; 10 \mathrm{~mol} \%$ ) and $\mathrm{Boc}_{2} \mathrm{O}(1.03 \mathrm{~g} ; 4.75 \mathrm{mmol} ; 1.2 \mathrm{eq}$ ) were added to a solution of ethyl 2-(3-methyl-1H-indol-2-yl)acetate ${ }^{[3]}$ ( $860 \mathrm{mg} ; 3.90 \mathrm{mmol}$ ) in THF ( 9.4 mL ) and the mixture was stirred at room temperature for 20 min . The mixture was diluted with dichloromethane, washed with 1 M KHSO 4 , saturated $\mathrm{NaHCO}_{3}$ and brine and dried over anhydrous $\mathrm{MgSO}_{4}$. The solvent was removed on rotovap, and the residue was purified by dry-flash chromatography (petroleum ether/EtOAc=95:5), to afford product 12, which was further purified by recrystallization from EtOAc/petroleum ether. A total of $740 \mathrm{mg}(60 \%)$ of pure product $\mathbf{1 2}$ was obtained, as a white microcrystalline solid.

$n$-Butyl lithium ( $c=1.3 \mathrm{M}, 0.65 \mathrm{~mL} ; 0.847 \mathrm{mmol} ; 1.1 \mathrm{eq}$ ) was added to a solution of diisopropylamine ( $120 \mu \mathrm{~L} ; 0.847 \mathrm{mmol} ; 1.1 \mathrm{eq}$ ) in dry THF ( 2 mL ) at $-20^{\circ} \mathrm{C}$, under argon. After 20 minutes of stirring, the solution of LDA was cooled down to $-78^{\circ} \mathrm{C}$, and a solution of ester 12 ( 245 mg ; 0.77 mmol ) in THF ( 2 mL ) was added. The pale yellow solution was stirred for 20 minutes, and a solution of aldehyde $\mathbf{1 3}^{[4]}$ ( $145 \mathrm{mg} ; 0.847 \mathrm{mmol} ; 1.1 \mathrm{eq}$ ) in THF ( 2 mL ) was introduced. The reaction mixture was allowed to reach $-40{ }^{\circ} \mathrm{C}$, over 30 minutes, and the reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$. The mixture was partitioned between water and ether, the organic extract was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The residue was dissolved in dry THF ( 5 mL ) and sodium hydride ( $24 \mathrm{mg} ; 1.0 \mathrm{mmol} ; 1.3 \mathrm{eq}$ ) was added in two portions, under an argon atmosphere. The reaction mixture was brought to reflux and, after 5 minutes, cooled down to the room temperature. Saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution was added, the product was extracted with ether, the organic extract was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated on rotovap. The residue was purified by column chromatography ( $\mathrm{PhH} / \mathrm{EtOAc}=8: 2$ ), to afford $213 \mathrm{mg}(75 \%)$ of acrylate $\mathbf{1 4}$, as a colorless oil. The yield of product 14, based on the recovered starting material 12 ( 49 mg ), was $93 \%$.

### 1.4 Tetracyclic aminoacetals 15 and 16

A solution of amine 10 ( $180 \mathrm{mg} ; 0.629 \mathrm{mmol}$ ) and aldehyde $\mathbf{1 1}{ }^{[5]}$ ( $285 \mathrm{mg} ; 1.257 \mathrm{mmol} ; 2 \mathrm{eq}$ ) in dry acetonitrile ( 15 mL ) was heated to $78{ }^{\circ} \mathrm{C}$ for 9 h , in the presence of $4 \AA$ molecular sieves ( 200 mg ). The reaction mixture was filtered through a plug of celite, the celite was washed with MeCN, and the filtrate was evaporated to dryness. The residue was dissolved in ethanol ( 10 mL ) and sodium borohydride ( 31 $\mathrm{mg} ; 0.817 \mathrm{mmol} ; 1.3 \mathrm{eq}$ ) was added at rt , to reduce the excess of selenoaldehyde $\mathbf{1 1}$. After 15 minutes of stirring, saturated ammonium chloride was added and the organics were extracted with ether, washed with brine and dried over anhydrous magnesium sulfate. The solvent was removed on rotovap to afford a 1:1 mixture of diastereomeric esters $\mathbf{1 5}$ and 16, separable on TLC. In order to perform the isomerization of 15 to 16, the crude mixture was dissolved in ethanol ( 10 mL ), DBU ( $470 \mu \mathrm{~L}$; 3.143 mmol; 5 eq) was added and the mixture was stirred at $70^{\circ} \mathrm{C}$ for 45 minutes. The mixture was diluted with ether, washed with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ and brine, dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated on rotovap. The residue was purified by column chromatography (PhH/EtOAc=95:5), to yield 220 mg ( $71 \%$ ) of ester 16, as a pale yellow oil. A smaller amount of a more polar diastereomer 15 was isolated ( 59 mg ; $19 \%$ ), which could be isomerized with DBU in another isomerization cycle.

### 1.7 Aldehyde 19

A solution of alcohol 18 ( $81 \mathrm{mg} ; 0.273 \mathrm{mmol}$ ), $\mathrm{OsO}_{4}$ ( $2.5 \%$ in $t$-BuOH; $73 \mu \mathrm{~L} ; 2 \mathrm{~mol} \%$ ) and NMO ( $50 \%$ solution in water; $280 \mu \mathrm{~L} ; 1.37 \mathrm{mmol} ; 5 \mathrm{eq}$ ) in $\mathrm{THF} / \mathrm{H}_{2} \mathrm{O}=2: 1(6 \mathrm{~mL})$ was stirred 13 h at room temperature. Excess of solid sodium-sulfite was added and the suspension was stirred for additional 30 minutes. The reaction mixture was diluted with ether, the organic layer was washed with brine and dried over anhydrous $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure, to afford 88 mg (98\%) of the dihydroxylated product, as a mixture of inseparable diastereoisomers, in form of a colorless solid. Lead tetraacetate ( $180 \mathrm{mg} ; 0.41 \mathrm{mmol} ; 1.5 \mathrm{eq}$ ) was added to a solution of crude triol ( $88 \mathrm{mg} ; 0.266$ mmol ) in ethyl acetate ( 75 mL ) and the mixture was stirred at room temperature for 30 minutes. The resulting orange suspension was filtered through a pad of celite and silica (eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}=9: 1$ ) and the clear filtrate was evaporated on rotovap, to yield crude aldehyde 19. This aldehyde ( 77 mg ) was used immediately for the preparation of lactone 6 , due to its high instability.

### 1.8 Lactone 6

DBU ( $34 \mu \mathrm{~L} ; 0.23 \mathrm{mmol} ; 1 \mathrm{eq}$ ) was added to a solution of a freshly prepared aldehyde 19 in chloroform ( 2 mL ), and the mixture was stirred at room temperature for 45 minutes. Dess-Martin periodinane ( 390 $\mathrm{mg} ; 0.92 \mathrm{mmol} ; 4 \mathrm{eq}$ ) was added to the reaction mixture and stirring was continued for 60 minutes. The mixture was diluted with ether, washed with $10 \%$ sodium thiosulfate solution, saturated sodium bicarbonate and brine, and the organic extract was dried over anhydrous $\mathrm{MgSO}_{4}$. After concentration on rotovap, the residue was purified by column chromatography ( $\mathrm{PhH} / \mathrm{EtOH}=9: 1$ ), to afford 23 mg ( $34 \%$ over 4 steps, from alkene 18) of pure lactone 6 , as a white solid.
