(Received 21 July 2004)
Abstract: The potential of directional non-bonded 1,5-type S $\cdots \mathrm{O}$ interactions to initiate the incipient stage of an in situ rearrangement of $N$-unsubstituted thiazolidine enaminones to functionalized 1,2-dithioles has been demonstrated. The spectral characteristics, as well as X-ray structural analysis of a selected rearranged product, indicate that a dynamic interconversion occurs in solution between the 1,2-dithiole and the $3,3 \mathrm{a} \lambda^{4}, 4$-trithia-1-azapentalene bicylic form. The lack of the rearrangement in the case of a $N$-methyl substituted enaminone precursor is attributed to an unfavorable methyl migration in the last reaction step.

Keywords: thiazolidine, enaminone, Lawesson's reagent, 1,2-dithiole, 3,3a $\lambda^{4}, 4$-tri-thia-1-azapentalene.

## INTRODUCTION

Investigation of the physicochemical properties and chemical reactivity of push-pull alkenes 1, carrying electron-donating groups(s) (EDG) on $\mathrm{C}(\beta)$ and strongly resonatively electron-withdrawing groups(s) (EWG) on $C(\alpha)$, is an on-going topic in organic chemistry. ${ }^{1,2}$

1
4-Oxothiazolidines $\mathbf{2 - 3}$, containing an exocyclic $\mathrm{C}=\mathrm{C}$ bond at the position $C(2)$, belong to push-pull enaminones which are widely used in organic synthesis. ${ }^{3,4}$ In addition, numerous thiazolidine derivatives have attracted considerable

[^0]attention because they exhibit diverse biological effects. ${ }^{5,6}$

2a: $\mathrm{R}^{1}=\mathrm{H} ; \mathrm{R}^{2}=\mathrm{H}$
2b: $\mathrm{R}^{1}=\mathrm{CH}_{3} ; \mathrm{R}^{2}=\mathrm{H}$
2c: $\mathrm{R}^{1}=\mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{Et} ; \mathrm{R}^{2}=\mathrm{H}$
3: $\mathrm{R}^{1}=\mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{Et} ; \mathrm{R}^{2}=\mathrm{CH}_{3}$
During the course of our studies on polarized thiazolidines, it has been shown that the enaminone moiety, $\mathrm{HN}-\mathrm{C}_{\beta}=\mathrm{C}_{\alpha}-\mathrm{C}=\mathrm{O}$, can be protected under alkaline conditions, thus permitting the regioselective reduction of a series of thiazolidine esters, such as $\mathbf{2 c}$, to alcohols. ${ }^{7}$ A similar concept, based on a prior protection of $\mathbf{2 c}$ via $N$-alkylation, was successfully exploited, at present in a single case, for the reductive heteroannulation of the N -methyl derivative 3 to a fused bicyclic 2 -alkylidenethiazolidine. On the other hand, a higher electrophilic reactivity of the enaminone electron-rich centre $\mathrm{C}_{\alpha}$ toward various brominating reagents, as compared to the electrophilic position $\mathrm{C}(5)$, has been demonstrated. ${ }^{8}$ Furthermore, the recently reported rearrangement of 4 -oxothiazolidines $\mathbf{2 a - c}$ to 1,2-dithioles $\mathbf{6 a - c}$ (Scheme 1) induced by a Lawesson's reagent [LR: (2,4-bis(4-methoxyphenyl)-1,3,2,4-dithiadiphosphetane 2,4 -disulfide], is dictated by intermolecular 1,5 -interactions of the nonbonded S and O in the cis-S-C=C-C- $=\mathrm{O}$ enaminone fragment of the corresponding precursor $2 .{ }^{9}$

Lawesson's reagent (LR):

As a continuation of our studies on the chemistry of thiazolidines, experimental evidence regarding the postulated mechanistic pathway of the $\mathbf{2} \rightarrow \boldsymbol{\rightarrow} \mathbf{6}$ rearrangement, including the controlled formation of intermediate(s) en route to product $\mathbf{6}$, is presented. The effect of structural change, i.e., the introduction of a methyl group at the $N$-position of the thiazolidine ring in the selected parent substrate, on the reaction course of ring transformation, as well as the overall reactivity of different carbonyl groups in the substrates 2-3 toward LR, was also investigated.

## RESULTS AND DISCUSSION

Based on the complete understanding of the structures and physicochemical properties of parent thiazolidines 2 , the $(Z)$-thioxothiazolidine-4-thione species 4 (Scheme 1) is proposed as the key intermediate responsible for the formation of the sole product $\mathbf{6}$ from the $(Z)-\mathbf{2}$ substrate and LR. In particular, the exact molecular structure of the prototype compound $2 \mathrm{~d}\left(\mathrm{R}^{1}: \mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{Et}\right.$ and $\mathrm{CO}_{2} \mathrm{Et}$ instead of COPh) was determined by X-ray crystallography. ${ }^{10}$ The determined distance between the sulfur and oxygen atoms of $2.873(2) \AA$, which corresponds to $89 \%$ of the sum of the van der Waals radii $(3.22 \AA),{ }^{11}$ implies strong non-bonded interactions. It is assumed that upon direct replacement of the carbonyl oxygen in $\mathbf{2 d}$ with a sulfur atom, the non-bonded $S \cdots S$ distance in the intermediate $\mathbf{4 d}$, as well as in $\mathbf{4 a - c}$, has to be very similar to the original value of 2.873(2) $\AA$ determined for the $\mathrm{S} \cdots \mathrm{O}$ distance. The distance is approximately $0.75 \AA$ shorter than the corresponding van der Waals distance between two sulfur atoms. ${ }^{12}$ The significant shortening of the non-bonded distance promotes close 1,5-contact. Subsequently, through-bond S-S interaction initiates an intramolecular rearrangement by a concerted thioxothiazolidine ring opening-closing process, followed by H-transfer (steps $\mathbf{4 \rightarrow 5} \rightarrow \mathbf{6}$ ). Amongst other recent examples, a similar close contact of the sulfur atoms has been recently recognized in the crystallographic structure of another thiazolidine derivative depicted by structure 7. ${ }^{13}$

2d

7

In general, starting from a colorless solution of equimolar quantities of $\mathbf{2}$ and LR in dry toluene, the corresponding orange crystalline 1,2-dithiole $\mathbf{6}$ was formed in high yield ( $90-98 \%$ ) upon heating the reaction mixture (3-4 h) in an oil bath at $90-95^{\circ} \mathrm{C}$. In order to test the mechanistic pathway (Scheme 1), 2b was subjected to a controlled thionation which was carefully monitored by TLC. The green crystalline thione derivative 8 was isolated in a moderate yield ( $44 \%$ ) after ten minutes, along with a small

amount of 1,2-dithiole $\mathbf{6 b}$ (10 \%). In terms of the rearrangement observed for 2a-c (Scheme 1), similar ring transformation and/or fragmentation of the initial thionation intermediate 8 to N -(5-phenyl-3 H -1,2-dithiol-3-ylidene)propionamide (9), or 1,2-dithiole 10, respectively, might be yet other processes (Scheme 2).

However, these side products were not formed under the conditions employed. In addition, the dithione intermediate $\mathbf{4 b}$, arising from subsequent thionation of the intermediate 8 , was not detected, as the facile ring opening, occurring with the concomitant ring-closing step to give $\mathbf{5 b}$, immediately follows. The close proximity of the sulfur atoms, combined with the push-pull effect of the enaminone unit are the two main factors, which act in the same direction. The thionation of the lactam carbonyl is probably the rate-determining step $(\mathbf{8} \rightarrow \mathbf{4 b})$ of the whole process. An alternative formation of the final product $\mathbf{6 b}$ by thionation of the 1,2-dithiole $\mathbf{9}$, generated via the $\mathbf{8} \rightarrow \mathbf{9}$ sequence, should not be completely ruled out. However, regardless of the strongly directing interaction between the two sulfur atoms in intermediate $\mathbf{8}$, the strongly electron-attracting ring carbonyl will make this ring opening-closing process less feasible. The related process in the case of the dithione $\mathbf{4 b}$ is enhanced as the oxygen/sulfur exchange at $\mathrm{C}(4)$ leads to the less electron-attracting thioxo group. It is worth mentioning that the green substrate $\mathbf{8}$ was converted in a preliminary solvent-free reaction, under relatively drastic conditions ( $30 \mathrm{~min}, \approx 175^{\circ} \mathrm{C}$ ) into an orange-red 1,2-dithiole-type product, the structure of which, not presently characterized, should be either 9 or $\mathbf{1 0}$. In anticipation of obtaining the key intermediate 4, the $N$-methyl thiazolidine precursor 3 was then prepared. It was reasoned that in this instance the required methyl shift, analogous to the hydrogen shift $\mathbf{5} \rightarrow \mathbf{6}$, as the final step ultimately leading to the rearranged product, would be disfavored. This proved to be the case, as treatment of $\mathbf{3}$ with LR under similar conditions as for the generation of 1,2-dithioles $\mathbf{6 a - c}$, afforded the expected dithione intermediate $\mathbf{1 2}$ and the initial thionation product $\mathbf{1 1}$ (Scheme 3 ).

The preferential formation of intermediate $\mathbf{1 2}$ was not necessarily the only outcome, since a potential fragmentation process may give rise to the 1,2-dithiole 13 and the thioketene 14. In fact, Vialle et al., ${ }^{14}$ reported a fragmentation of this type for $N$-phenyl-5,5-disubstituted 4-thiazolidinones under harsh experimental conditions. However, compounds $\mathbf{1 3}$ and $\mathbf{1 4}$ were not observed under the experimental reaction conditions employed. As observed in the reaction scheme, a rearranged product was not obtained from $\mathbf{1 2}$, most likely due to the necessary methyl migration being unfavorable, whereas the analogous hydrogen shift in the case of precursors $\mathbf{2 a - c}$ is favorable (see Scheme 1, step $\mathbf{5} \rightarrow \mathbf{6}$ ). Upon reducing the reaction time ( 10 min ), the reaction of $\mathbf{3}$ with LR proceeded in a stepwise manner to give exclusively the initial thionation derivative 11 in $64 \%$ yield. In light of these results, the reactivity of the carbonyl groups of thiazolidines $\mathbf{2}$ and $\mathbf{3}$ toward LR reflects the established trend of the rates of thionation, as follows: ketone $>$ lactam $\ggg$ ester. ${ }^{15,16}$ Actually, the ester functionality at $\mathrm{C}(5)$ stayed intact even after a prolonged reaction time (5-7 h).

The structures of all thionation and rearranged products were elucidated on the basis of their spectroscopic and analytical data (see Experimental). Comparison of the selected ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$-NMR chemical shifts for the pairs of parent thiazolidine and corresponding thionation product $\mathbf{2 b} / \mathbf{8}, \mathbf{3 / 1 1}$ and $\mathbf{3 / 1 2}$ revealed a complete regularity based on the enhanced anisotropic effect of the thiocarbonyl group relative to that of the carbonyl group (Table I). ${ }^{17-20}$

TABLE I. Selected ${ }^{13} \mathrm{C}$ and ${ }^{1} \mathrm{H}$ chemical shifts (ppm) for the parent thiazolidines $\mathbf{2 b}$ and $\mathbf{3}$ and the thionation derivatives 8, 11 and $\mathbf{1 2}$

| Entry | Compound | $\mathrm{C}(2 \alpha) \mathrm{H}$ | $\mathrm{NCH}_{3}$ | $\mathrm{C}=\mathrm{O}_{\text {exo }}$ | $\mathrm{C}=\mathrm{S}_{\text {exo }}$ | $\mathrm{C}=\mathrm{O}_{\text {lactam }} \quad \mathrm{C}=\mathrm{S}_{\text {lactam }}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| 1 | $(Z) \mathbf{- 2 b}\left(\right.$ DMSO- $\left.d_{6}\right)$ | 6.78 |  | 187.4 |  |  |  |
| 2 | $(Z) \mathbf{- 8}\left(\right.$ DMSO- $\left._{6}\right)$ | 7.58 |  |  | 213.6 |  |  |
| 3 | $(Z) \mathbf{- 3}\left(\mathrm{CDCl}_{3}\right)$ | 6.95 | 3.28 | 187.8 |  | 174.5 |  |

The signals for the olefinic protons of thiazolidines (entries 1 and 3 ) are at higher field than those of the corresponding sulfur analogues (entries 2, 4 and 5). The same feature is illustrated for the pair $\mathbf{3 / 1 2}$, where a downfield shift of $c a .0 .5 \mathrm{ppm}$ is observed for the methyl protons in $\mathbf{1 2}(\delta 3.83 \mathrm{ppm})$ relative to $\mathbf{3}(\delta 3.28 \mathrm{ppm})$.

The ${ }^{13} \mathrm{C}$-NMR data are also consistent with the increased anisotropic effect of a thiocarbonyl moiety. The signals at $\delta 174.5$ and 187.8 ppm for the compound $(Z)-3$ (entry 3 ) are ascribed to the lactam carbonyl and the $\mathrm{C}=\mathrm{O}$ ketone, respectively. As discussed above, the chemical shifts of the thiocarbonyl groups of the dithione 12 (entry 5), resulting from the oxygen-sulfur exchange, are in the $205-218 \mathrm{ppm}$ range i.e., at a lower field than those of the parent thiazolidine $\mathbf{3}$.

The MS, UV, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectroscopic data for the rearranged products are in good agreement with the 1,2-dithiole structure $\mathbf{6}$ and the fused bicyclic aromatic $3,3 a \lambda^{4}, 4$-trithia-1-azapentalene system 6 A in a continuous equilibrium. ${ }^{12}$ In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra (in $\mathrm{CDCl}_{3}$ ), the proton at $\mathrm{C}(4)$ of the derivatives $\mathbf{6 a}, \mathbf{6 b}$ and $\mathbf{6 c}$ absorbs at a very low field, i.e., at $8.37,8.42$ and 8.37 ppm , respectively, which is indicative of the aromatic nature of these compounds. Interconversions of the $\mathbf{6} \leftrightarrow \mathbf{6} \mathbf{A}$ type have been the subject of numerous investigations. ${ }^{21-25}$

6

6A

6B

Formula 6B, depicting a partial bonding between the sulfur atoms, is another acceptable bonding pattern for this trisulfur bicyclic ring system, whereas structure 6A implies a $\sigma$ bond connecting the internal hypervalent sulfur atom with the terminal $\mathrm{S}(3)$ and $\mathrm{S}(4)$ atoms. As discussed in a comprehensive review by N . Lozac' $H,{ }^{12}$ the related $1,6,6 a \lambda^{4}$-trithiapentalenes $\mathbf{1 5}$, as typical $10 \pi$-electron with $\mathrm{C}_{2 v}$ symmetry, are best represented as being in rapid interconversion with the 1,2-dithiol-3-ylidene thiones 15A.

15
15A
Finally, as indicated in Scheme 1 the scope of this rearrangement reaction is demonstrated by employing the thiazolidine-type enaminones $\mathbf{2 a - c}$. The sin-gle-crystal X-ray analysis of $\mathbf{6 c}$ shown in Fig. 1, confirmed the trithiaazapentalene structure (formulae $\mathbf{6 A}$ or $\mathbf{6 B} ; \mathrm{R}^{1}=\mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{Et}$ ).

Fig. 1. Solid-state structure for compound $\mathbf{6 c}$ as established by X-ray diffraction with the atom numbering-scheme for non-hydrogen atoms.

In addition to the nearly linear $S(1)-S(2)-S(3)$ array $\left(175^{\circ}\right)$, the two $S-S$ bonds, being 2.36 and $2.29 \AA$, respectively, are not of exactly the same length as the structures of the two fused rings differ. The computed sulfur-sulfur single bond length in a cis planar disulphide group is $2.08 \AA$ and accordingly, the order of this bond is 1 . Based on a correlation between the bond order and bond length, the assumed bond order in the structure $\mathbf{6 A}$ and in analogous trithiapentalenes in the solid state ${ }^{26,27}$ is lower than 1 , supporting the partial covalent bonding of the trisulfur-sequence.

## EXPERIMENTAL

Melting points were determined on a Micro-Heiztisch Boetius PHMK apparatus or a Büchi apparatus and are uncorrected. The IR spectra were recorded on a Perkin-Elmer FT-IR 1725X spectrophotometer and are reported as wave numbers $\left(\mathrm{cm}^{-1}\right)$. Samples for IR spectral measurements were prepared as KBr disks. The NMR spectra were obtained using a Varian Gemini 2000 instrument ( ${ }^{1} \mathrm{H}$ at $200 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 50.3 MHz ). ${ }^{13} \mathrm{C}$-NMR resonance assignments were aided by the use of the DEPT technique to determine the numbers of attached hydrogens. The chemical shifts are reported in parts per million ( ppm ) on the $\delta$ scale from TMS as an internal standard in the solvents specified. Low-resolution mass spectra were recorded using a Finnigan MAT 8230 BE spectrometer at 70 eV (EI). Isobutane was used as the ionizing gas for the chemical ionization (CI) mass spectra. The UV spectra were measured on a Beckman DU-50 spectrophotometer. Analytical thin-layer chromatography (TLC) was carried out on Kieselgel G nach Stahl, and the spots were visualized by iodine. Column chromatography was carried out on $\mathrm{SiO}_{2}$ (silica gel $60 \AA, 12-26$, ICN Biomedicals). Elemental analyses were performed at the microanalysis laboratory at the Department of Chemistry, University of Belgrade.

## General procedure for the preparation of the rearranged derivatives $\mathbf{6 a} \boldsymbol{a} \mathbf{c}$

A colorless solution of ( $Z$ )-2-alkylidene-4-oxothiazolidine 2a-c ( 0.164 mmol ) and LR ( 0.164 mmol ) in dry toluene ( 3 mL ) was heated in an oil bath at $90-95^{\circ} \mathrm{C}$ (the initially heterogeneous system at room temperature became homogenous upon heating at around $75^{\circ} \mathrm{C}$ ). After a few minutes, the color of the reaction mixture turned dark reddish brown. CAUTION: All reactions involving Lawesson's reagent, due to the unpleasant odor, should be carried out in a well-ventilated hood. The mixture was stirred at this temperature for an additional hour when TLC indicated the substrate 2a-c had been completely consumed. After cooling to room temperature, the solvent was evaporated in vacuo. The residue was chromatographed (toluene/ethyl acetate, $10: 0 \rightarrow 8: 2$, $\mathrm{v} / \mathrm{v}$ ) affording the dark-orange, crystalline 1,2 -dithiole $\mathbf{6 a - c}$ in high yields ( $90-98 \%$ ). The structural assignments of all the isolated products were made on the basis of spectroscopic data (IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}, \mathrm{MS}, \mathrm{UV}$ ) and elemental analysis. Compound 6a was previously described. ${ }^{28}$ Note: It should be emphasized that the assignments are based on 1,2-dithiole structures $\mathbf{6}$ which are in continuous equilibrium with the $3,3 \mathrm{a} \lambda^{4}, 4$-trithia-1-azapentalene forms $\mathbf{6 A}$.

## $N$-(5-Phenyl-[1,2]dithiol-3-ylidene)thioacetamide (6a)

From $2 \mathbf{2 a}(50 \mathrm{mg}, 0.228 \mathrm{mmol})$ in toluene $(4 \mathrm{~mL})$ and $\mathrm{LR}(87 \mathrm{mg}, 0.228 \mathrm{mmol})$ after column chromatography (toluene/EtOAc 10:0 to 8:2), the 1,2-dithiole 6a was isolated; yield 57 mg ( $99 \%$ ); mp 98 ${ }^{\circ} \mathrm{C}$. IR (KBr): $v_{\text {max }} 3004,2908,1638,1514,1485,1447,1404,1226,1205,989,846,757,690,642$ $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 2.86\left(3 \mathrm{H}, s, \mathrm{CH}_{3}\right), 7.42-7.53(3 \mathrm{H}, m, m$ - and $p-\mathrm{Ph}), 7.75-7.84(2 \mathrm{H}, m$, $o-\mathrm{Ph}), 8.37(1 \mathrm{H}, \mathrm{s},=\mathrm{CH}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 29.1\left(\mathrm{CH}_{3}\right), 125.8(=\mathrm{CH})$, $127.4(o-\mathrm{Ph}), 129.0(\mathrm{~m}-\mathrm{Ph})$, 131.0 ( $p-\mathrm{Ph}$ ), 136.2 ( $\left.\mathrm{C}_{\mathrm{ipso}}-\mathrm{Ph}\right), 178.5(\mathrm{C}=C-\mathrm{S}), 187.3(\mathrm{~N}=\mathrm{C}-\mathrm{S}), 198.6$ (C=S); MS (EI): m/z (rel. intensity): 251 ( $\mathrm{M}^{+}, 35$ ), 236 (15), 210 (5), 193 (7), 174 (3), 145 (13), 121 (18), 102 (20), 89 (3), 77 (13) 59 (100), 39 (3); UV (DMSO): $\lambda_{\text {max }}(\varepsilon) 333 \mathrm{~nm}(15,250)$ and $446 \mathrm{~nm}(11,300)$. Anal: Calcd. for $\mathrm{C}_{11} \mathrm{H}_{9} \mathrm{NS}_{3}$ : C, $52.56 ; \mathrm{H}, 3.61 ; \mathrm{N}, 5.57 ; \mathrm{S}, 38.26$; Found: C, $52.68 ; \mathrm{H}, 3.71 ; \mathrm{N}, 5.63 ; \mathrm{S}, 37.88$.

## $N$-(5-Phenyl-[1,2]dithiol-3-ylidene)thiopropanamide (6b)

From $\mathbf{2 b}(40 \mathrm{mg}, 0.17 \mathrm{mmol})$ in toluene $(4 \mathrm{~mL})$ and LR ( $70 \mathrm{mg}, 0.17 \mathrm{mmol}$ ) after column chromatography (petroleum ether/EtOAc 10:0 to 10:0.4), the 1,2-dithiole $\mathbf{6 b}$ was isolated; yield 39 mg ( $85 \%$ ); mp 54-56 ${ }^{\circ} \mathrm{C}$. IR (KBr): $v_{\text {max }} 3142,3013,2965,2927,2891,1518,1481,1448,1396,1290$, 1227, 1195, 1065, 1000, 944, 841, 761, $693 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 1.44\left(3 \mathrm{H}, t, J=7.4 \mathrm{~Hz}, \mathrm{CH}_{3}\right)$, $3.12\left(2 \mathrm{H}, q, J=7.4 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 7.47-7.50(3 \mathrm{H}, m, m-$ and $p-\mathrm{Ph}), 7.83-7.88(2 \mathrm{H}, m, o-\mathrm{Ph}), 8.42(1 \mathrm{H}, s$, $=\mathrm{CH}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 13.8\left(\mathrm{CH}_{3}\right), 35.8\left(\mathrm{CH}_{2}\right), 126.0(=\mathrm{CH}), 127.5(o-\mathrm{Ph}), 129.1(\mathrm{~m}-\mathrm{Ph})$, $131.0(p-\mathrm{Ph}), 136.7\left(\mathrm{C}_{\mathrm{ipso}}-\mathrm{Ph}\right), 178.7(\mathrm{C}=C-\mathrm{S}), 187.8(\mathrm{~N}=\mathrm{C}-\mathrm{S}), 204.9(\mathrm{C}=\mathrm{S}) ; \mathrm{UV}(\mathrm{DMSO}): \lambda_{\max }(\varepsilon)$ $332 \mathrm{~nm}(15,250)$ and $446 \mathrm{~nm}(11,300)$. Anal: Calcd. for $\mathrm{C}_{12} \mathrm{H}_{11} \mathrm{NS}_{3}: \mathrm{C}, 54.32 ; \mathrm{H}, 4.15 ; \mathrm{N}, 5.28$. Found: C, 54.14; H, 4.18; N, 5.26.

## Ethyl 3-(5-phenyl-[1,2]dithiol-3-ylidenethiocarbamoyl)propanoate (6c)

From $2 \mathrm{c}(50 \mathrm{mg}, 0.16 \mathrm{mmol})$ in toluene $(4 \mathrm{~mL})$ and LR ( $66 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) after column chromatography (toluene/EtOAc 3:1 to 1:1), the 1,2-dithiole 6c was isolated; yield 51 mg ( $92 \%$ ); mp 65 ${ }^{\circ} \mathrm{C}$. IR (KBr): $v_{\text {max }} 3067,3006,2978,2925,2855,1730,1512,1483,1450,1426,1401,1375,1305$, 1177, 1157, 1107, 1049, 1015, 945, 867, 830, 760, $687 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 1.26(3 \mathrm{H}, t, J=$ $\left.7.2 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 2.92\left(2 \mathrm{H}, t, J=7.3 \mathrm{~Hz}, \mathrm{CH}_{2}-\mathrm{CO}\right), 3.40\left(2 \mathrm{H}, t, J=7.3 \mathrm{~Hz}, \mathrm{CH}_{2}-\mathrm{CS}\right), 4.17(2 \mathrm{H}, q, J=$ $\left.7.0 \mathrm{~Hz}, \mathrm{CH}_{2}-\mathrm{O}\right), 7.41-7.53(3 \mathrm{H}, m, m$ - and $p-\mathrm{Ph}), 7.78-7.87(2 \mathrm{H}, m, o-\mathrm{Ph}), 8.37(1 \mathrm{H}, s,=\mathrm{CH})$; ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 14.7\left(\mathrm{CH}_{3}\right), 32.9\left(\mathrm{CH}_{2}-\mathrm{CO}\right), 37.5\left(\mathrm{CH}_{2}-\mathrm{CS}\right), 60.6\left(\mathrm{CH}_{2}-\mathrm{O}\right), 126.4(=\mathrm{CH})$, $127.4(o-\mathrm{Ph}), 129.1(m-\mathrm{Ph}), 131.1(p-\mathrm{Ph}), 136.0\left(\mathrm{C}_{\mathrm{ipso}}-\mathrm{Ph}\right), 172.2\left(\mathrm{CO}_{\mathrm{ester}}\right), 177.5(\mathrm{C}=C-\mathrm{S}), 187.4$ ( $\mathrm{N}=\mathrm{C}-\mathrm{S}$ ), 201.9 (C=S); MS (EI): m/z (rel. intensity): 337 ( $\mathrm{M}^{+}, 38$ ), 304 (65), 277 (7), 264 (8), 236 (100), 211 (15), 194 (10), 178 (20), 145 (38), 117 (73), 102 (33), 71 (45), 55 (65); UV (DMSO): $\lambda_{\text {max }}$ (ع) $332.6(15,990)$ and $446.1 \mathrm{~nm}(12,720)$. Anal: Calcd. for $\mathrm{C}_{15} \mathrm{H}_{15} \mathrm{NO}_{2} \mathrm{~S}_{3}$ : C, $53.39 ; \mathrm{H}, 4.48 ; \mathrm{N}$, 4.15; S, 28.50; Found: C, 53.15; H, 4.45; N, 4.24; S, 27.97.

## (Z)-2-(5-Methyl-4-oxothiazolidin-2-ylidene)-1-phenylethanethione (8)

From $2 \mathbf{b}(54 \mathrm{mg}, 0.23 \mathrm{mmol})$ in toluene ( 5 mL ) and LR ( $94 \mathrm{mg}, 0.23 \mathrm{mmol}$ ), at $90-95^{\circ} \mathrm{C}, 10$ min, after column chromatography (toluene/EtOAc 10:0 to 10:0.3), the (Z)-2-(5-methyl-4-oxothia-zolidin-2-ylidene)-1-phenylethanethione (8) was isolated; yield $25 \mathrm{mg}(44 \%)$; mp $184-186^{\circ} \mathrm{C}$. IR (KBr): $v_{\text {max }} 3405,3094,3022,2935,2896,1691,1535,1476,1447,1367,1308,1219,1073,1000$, $840,768,743,692 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-d_{6}\right): \delta 1.52\left(3 \mathrm{H}, d, J=7.4 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 4.10(1 \mathrm{H}, q, J=7.4$ $\mathrm{Hz}, \mathrm{SCH}), 7.43-7.48(3 \mathrm{H}, m, m$ - and $p-\mathrm{Ph}), 7.58(1 \mathrm{H}, s,=\mathrm{CH}), 7.70-7.74(2 \mathrm{H}, m, o-\mathrm{Ph}), 12.30(1 \mathrm{H}$, $s, \mathrm{NH}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-d_{6}\right): \delta 17.3\left(\mathrm{CH}_{3}\right), 41.6(\mathrm{SCH}), 111.6(=\mathrm{CH}), 126.6(o-\mathrm{Ph}), 128.6(\mathrm{~m}-\mathrm{Ph})$, $130.9(p-\mathrm{Ph}), 146.8\left(\mathrm{C}_{\mathrm{ipso}}-\mathrm{Ph}\right), 166.0(\mathrm{C}=\mathrm{CH}), 178.0(\mathrm{CO}), 213.6(\mathrm{C}=\mathrm{S}) ; \mathrm{UV}\left(\mathrm{CHCl}_{3}\right): \lambda_{\max }(\varepsilon) 330$ $\mathrm{nm}(17,300)$ and $416.0 \mathrm{~nm}(23,300)$. ## ТИОНОВАЊЕ $N$-МЕТИЛ- И $N$-НЕСУПСТИТУИСАНИХ ТИАЗОЛИДИНОНСКИХ ЕНАМИНОНА

РАДЕ МАРКОВИЋ ${ }^{\text {а, }}$, , АЛЕКСАНДАР РАШОВИЋ ${ }^{\text { }}$, МАРИЈА БАРАНАЦ ${ }^{\text {а, }}{ }^{\text {, }}$, МИЛОВАН СТОЈАНОВИЋ ${ }^{\text {б }}$, PETER J. STEEL ${ }^{\text {Ц }}$ и СТАНКА JOBETИЋ ${ }^{\text {Д }}$

[^1]Показан је потенцијал усмерених невезивних S " ${ }^{\text {O }}$ интеракција 1,5 -типа да иницирају почетну фазу in situ премештања $N$-несупституисаних тиазолидинонских енаминона у функционализоване 1,2 -дитиоле. Спектралне карактеристике, као и кристалографска структурна анализа изабраног премештеног производа, указују на брзу интерконверзију између 1,2 -дитиола и $3,3 \mathrm{a} \lambda^{4}, 4$-тритија-1-азапенталенског бицикличног облика. Одсуство премештања у случају $N$-метил-супституисаног енаминомског прекурсора приписано је нефаворизованом премештању метил-групе у завршној фази реакције.
